The Day I Imagined the Ocean

Virgine Novarina, Walid Breidi & LABOFACTORY (Jean-Marc Chomaz, Laurent Karst) – March 23, 2023

•sleep •dream •quantic •brainwaves •ocean •fluids •shadowgraphy •invisibility •imaginary

While a sleeper may seem inert, their brain is going through subconscious creative states. Nonrapid eye movement sleep in particular is associated with a lesser perception of their self and their environment. During this stage, intense exchanges occur between brain regions.

The brain is a fathomless entity involving billions of interconnected neurons exchanging electrical, chemical, and physical signals. The electronic activity is described by the Schrodinger equation of quantum mechanics for the wave function associated with the electrons shared between all the cells. The wave-particle duality applies and, depending on the measurement apparatus, electrons may be observed as a coherent wave pattern covering large regions of the brain or as particles localized on individual neurons. Thus, thoughts and dreams belong to the wave functions space, neither undulatory nor corpuscular, and any measurement corresponds to an arbitrary projection. Alpha, beta ... delta waves are such observables, traditionally used to project quantic states of mind onto a predetermined representation. But what is lost or gained in such a simple abecedary?

To explore the richness of brain activity during sleep, sleep artist Virgile Novarina, in collaboration with digital artist Walid Breid, has teamed up with physicist-artist Jean-Marc Chomaz and architect-designer Laurent Karst of LABOFACTORY, who produce art installations to question our relationships with wind, waves, clouds, and oceans.

"Full fathom five thy father lies,"¹ the ocean, origin and close, limbo and shroud. The ocean transmits electromagnetic signals only a few meters down. Deeper data may only be collected through sound scattering or water-born measurements from ships, buoys, or gliders. The ocean is animated by streams, vortices, and waves at all scales. Water masses retain the elusive memory of the Earth's climate at the time they left the surface and sunk deep. The associated vertical circulation is slow, one thousand years to close the loop. It is called Thermohaline Circulation, driven by heat and salt density variations.

Presently, it is tempering global warming, returning the heat of the past. But its fate in the changing world is unknown. Could the oceanic circulation stops leading to the next anoxic event as in previous geological periods?

Rêve quantique: The Day I Imagined the Ocean is conceived as an immersive installation that creates connections between the brain and the ocean, both unfathomable. An installation that keeps the quantum idea of projection onto observables that define a system of states, similar in their semantics for ocean and brain: waves, vortexes, streams, and pulsations. What would happen if the semantics of one universe is translated into the other, in a kind of inside out automatic writing? Would the visitor entering the transcoded world feel themselves diving into the dream or falling into the ocean or would reality itself be subdued, the visitor drowned in their own unconscious?

The documentary film traces the project's genesis and the research involved. The film brings together the two unfathomable worlds, sleep and the ocean. It constitutes a visual exploration of the space opened up by the imbalance between the poetic dimensions of the project, the scientific facts and knowledge, and the human experience of shared research.

The documentary also interrogates the experience of a visitor entering the intimate space with the sleeper in his bed, close to a sort of a lighthouse that contains a miniature ocean. Getting closer, she notices the headband, the cellphone monitoring the brain waves. On the floor she observes the shadowgraphic projection of the internal oceanic movements making a bright changing circle 4 meters in diameter. What is the connection? The artists have patiently built an abecedary of delta wave states from measurements. The time series of different states forms a never-ending phrase transcoded live into a second abecedary to control a motorized device at the surface of the ocean mimicking the wind-driven entrainment. Could the visitor perceive that? Or be lost in the translation, dreaming with the ocean, flowing with the sleeper?

1. William Shakespeare, *The Tempest*, Act 1, Scene 2.

The day I imagined the ocean
deep and shallow
slow tide
bounded to no shore
the light folding into shadows

the earth, the water, and the sky, or space

of our lives sleeping,
about a third of it.

When you get to remember
a little bit or explore

we realize that this is
a time when the brain is very creative

but which, unfortunately,
we are not aware of.

And since, on the contrary, I find it
a very rich moment in life,

I felt like showing it
and sleep in public

I practice sleep deprivation.
I accumulate a kind of debt

to show real sleep
as a result of being tired

So this sleep deprivation,
which is for me a conditioning process,

has become a kind of ritual
before any performance

during which I spend in general
two sleepless nights to become

no matter what the conditions are
and no matter how many people

without sleep, I fall into sleep
as if I was a little catapulted

into the depths of sleep.

Virgil suggested that I do
something with sleep;

which raised some problems
because he is totally motionless.

And when he described to me
what he was doing in his sleep

and how he woke up
to write down his thoughts at night,

I had the impression that he was a little bit
like a pearl diver.

was going into the depths of the sea.

he rarely finished his sentences,

Creating an echo.

The sleeper dives into her or his sleep

and when he wakes up, maybe
he has a mind full of dreams,

And when he wakes up,
he forgets everything.

This is what gave the idea
for the first project, "The Paradoxical
Bubble" / "La Bulle paradoxale"

two installations that involved
brain waves of sleep:

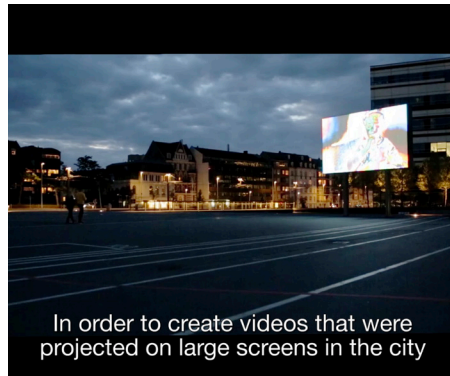

So, we connect a little bit the world of
wakefulness and the world of sleep

it was in Denmark, in Aarhus,
it's called "Sleep in the City".

but in a collective
and participatory way,

In order to create videos that were
projected on large screens in the city

"Quantum Dream" is
technically autonomous

because it is like a heart
that beats by itself.

"Rêve quantique" was born from
the encounter between Walid Breidi
and me, on the one hand,

and between Jean-Marc Chomaz and
Laurent Karst, from LaboFactory; in fact,

to finally materialize these sleep waves,

but to try to translate the richness
of the states of sleep inside

And when I spoke about this
with Jean-Marc Chomaz,
at LadHyX (École polytechnique)

We know that the time scale
is dynamic.

But these movements are invisible,

the light itself with
these layers of water.

There is a cylinder, disks
in the lower part, and devices.

And it is this, in fact, that will
retransmit the cerebral waves.

that can tell this relationship
with the ocean.

And then everything there is circular,
seen from above,

Here is almost in the dark.

And there, we find even in
"Quantum Dream", the idea of the shadow.

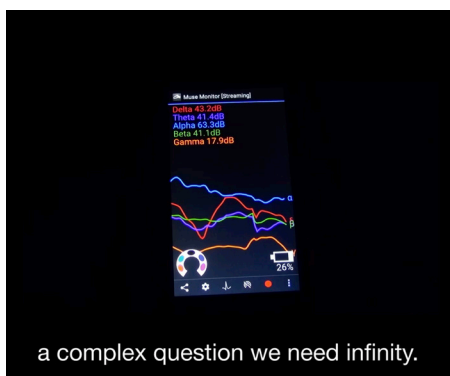

It's a space that is
really inaccessible to us.

But we will be able to access this space
with a projection

a space which is observable,
measurable, with values,

a complex question we need infinity.

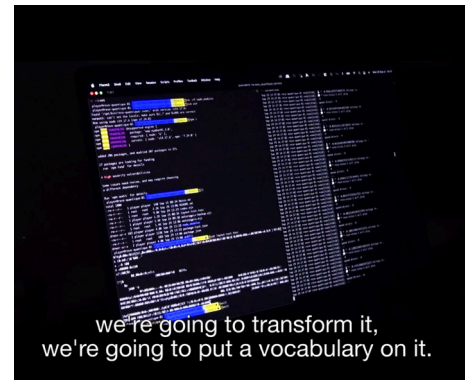

And In "Quantum Dream"
we connected two infinities;

we have projected the reality of the sleeper
on a very small reality of the world.

We're going to transcode this wave,

we're going to transform it,
we're going to put a vocabulary on it.

That is to say, we are going to use words
and the words sequence ideas into objects,

When Virgil sleeps, he writes
a huge poem by putting

the whole of these words
one after the other.

It's this that we will time
afterwards, then.

When we will control the speed,
and after that it will stop.

There, you see all the states

there are variations
because we don't know

which value of the brain it will receive.

So there lies the randomness:
because when we sleep

you won't get twice
the same waves at the same time.

We define states with speeds.

And then afterwards, the ocean will respond
according to its own state.

is entirely dependent
on this basin

But the shadowgraphy, the image
we're going to get

There, already, the speed,

trying to control and let go simultaneously,

is an artistic method,
a creation of an artistic universe.

is a painting in time and space with
an ensemble of shapes.

during sleep, we don't really realize
that the brain is active

when Virgil sleeps,
he emits cerebral waves

There are cleaning waves

of the cephalic-spinal fluid within the brain

It will come to clean the neurons and
remove the plaques of proteins

There is also the feeling
of time that stands still

to meditate or to reflect

in an eye, it feels like I stand
in the eyes of the ocean.

which are obviously what's
going on in his mind.

We have the feeling of a mausoleum telling
ourselves we are in some sacred space.

some sounds from the planet Neptune
because I remembered

We spend the biggest part

- and the mirror of things.

We always talk about the "day";
we say: the day I was born,

that a day is the interval between
sunrise and sunset.

are somehow frustrated by this part
of our life that we don't know;

And I think, we'd be more fulfilled,
happier, more balanced.

if we knew our sleeping life better.

The installation-performance “Rêve quantique: The Day I imagined the Ocean” was collectively conceived from 2018 to 2022 at the Hydrodynamics laboratory of École Polytechnique (LadHyx), CNRS – École Polytechnique, with the support of La Chaire Arts & Sciences of École Polytechnique, École des Arts Décoratifs, and La Fondation Daniel et Nina Carasso.

We would like to thank the places and structures that have supported and exhibited the successive prototypes of “Rêve quantique” during the research period: musée des Arts et Métiers, Paris – Night of Ideas 2020; CC91 La Science de l’Art Biennial – la Piscine d’en Face, Sainte-Geneviève-des-Bois; Festival access)s(– Le Bel Ordinaire, Pau; Nemo Biennial – La Scène de recherche ENS Paris-Saclay; Festival ZÉRØ1 – La Coursive, La Rochelle; Festival Les Nuits d’Orient – Un singe en hiver; Dijon; Institut Français, and La Chaire Arts & Sciences.

about the authors

Virgile Novarina, after studying mathematics and physics, devoted himself to the artistic exploration of his own sleep through writings, drawings, photographs, and films. The very act of sleeping has become an integral part of his work through performances during which he sleeps publicly. His encounter with digital artist Walid Breidi led to different projects involving brainwaves, interactivity, and digital art.

Walid Breidi is a multidisciplinary digital artist. His creative tools come from the digital technology that surrounds us and on which we increasingly depend in our daily lives. His encounter with Virgile Novarina in 2010, led to three projects articulating sleep art with digital art: Paradoxical Bubble, Sleep in the City, and Quantum Dream.

LABOFACTORY is an experimental artistic collective created in 2005. It explores a territory between arts and sciences, a research space favourable to a shared imagination and new narratives, to redefine the vision and ethics of science and art in a sensitive and poetic narration of the world.

Jean-Marc Chomaz (PhD) is an artist physicist, director of research at the CNRS, professor at the École Polytechnique, co-founder of the LABOFACTORY collective, and co-bearer of the Chaire Arts & Sciences

Laurent Karst is an architect-designer, graduated from the Strasbourg School of Architecture and the Domus Academy of Milan in industrial design.
